The Computational Brain (Computational Neuroscience)

Patricia Smith Churchland, Terrence J. Sejnowski

The Computational Brain (Computational Neuroscience) Patricia Smith Churchland, Terrence J. Sejnowski

How do groups of neurons interact to enable the organism to see, decide, and move appropriately? What are the principles whereby networks of neurons represent and compute? These are the central questions probed by *The Computational Brain*. Churchland and Sejnowski address the foundational ideas of the emerging field of computational neuroscience, examine a diverse range of neural network models, and consider future directions of the field. *The Computational Brain* is the first unified and broadly accessible book to bring together computational concepts and behavioral data within a neurobiological framework.

Computer models constrained by neurobiological data can help reveal how -- networks of neurons subserve perception and behavior -- how their physical interactions can yield global results in perception and behavior, and how their physical properties are used to code information and compute solutions. *The Computational Brain* focuses mainly on three domains: visual perception, learning and memory, and sensorimotor integration. Examples of recent computer models in these domains are discussed in detail, highlighting strengths and weaknesses, and extracting principles applicable to other domains. Churchland and Sejnowski show how both abstract models and neurobiologically realistic models can have useful roles in computational neuroscience, and they predict the coevolution of models and experiments at many levels of organization, from the neuron to the system.

The Computational Brain addresses a broad audience: neuroscientists, computer scientists, cognitive scientists, and philosophers. It is written for both the expert and novice. A basic overview of neuroscience and computational theory is provided, followed by a study of some of the most recent and sophisticated modeling work in the context of relevant neurobiological research. Technical terms are clearly explained in the text, and definitions are provided in an extensive glossary. The appendix contains a précis of neurobiological techniques.

The Computational Brain is the first unified and broadly accessible book to bring together computational concepts and behavioral data within a neurobiological framework. Churchland and Sejnowski address the foundational ideas of the emerging field of computational neuroscience, examine a diverse range of neural network models, and consider future directions of the field.

From reader reviews:

Robert Marques:

Do you have favorite book? When you have, what is your favorite's book? Reserve is very important thing for us to find out everything in the world. Each e-book has different aim as well as goal; it means that guide has different type. Some people really feel enjoy to spend their time for you to read a book. They are reading whatever they have because their hobby is definitely reading a book. Think about the person who don't like reading through a book? Sometime, particular person feel need book once they found difficult problem as well as exercise. Well, probably you will need this The Computational Brain (Computational Neuroscience).

Donald Diaz:

Reading a book tends to be new life style in this era globalization. With examining you can get a lot of information that may give you benefit in your life. Using book everyone in this world can certainly share their idea. Guides can also inspire a lot of people. Many author can inspire their particular reader with their story or maybe their experience. Not only the story that share in the books. But also they write about the knowledge about something that you need instance. How to get the good score toefl, or how to teach your kids, there are many kinds of book that you can get now. The authors on earth always try to improve their proficiency in writing, they also doing some investigation before they write with their book. One of them is this The Computational Brain (Computational Neuroscience).

Dolores Rawson:

Spent a free time and energy to be fun activity to try and do! A lot of people spent their sparetime with their family, or their friends. Usually they accomplishing activity like watching television, planning to beach, or picnic within the park. They actually doing same task every week. Do you feel it? Will you something different to fill your current free time/ holiday? Might be reading a book can be option to fill your free time/ holiday. The first thing that you'll ask may be what kinds of publication that you should read. If you want to consider look for book, may be the book untitled The Computational Brain (Computational Neuroscience) can be fine book to read. May be it could be best activity to you.

Robert Alston:

E-book is one of source of information. We can add our know-how from it. Not only for students but in addition native or citizen need book to know the up-date information of year to be able to year. As we know those publications have many advantages. Beside we add our knowledge, also can bring us to around the world. With the book The Computational Brain (Computational Neuroscience) we can acquire more advantage. Don't one to be creative people? For being creative person must prefer to read a book. Just simply choose the best book that suited with your aim. Don't always be doubt to change your life at this book The Computational Brain (Computational Neuroscience). You can more inviting than now.
